Vector fields

Robin Aldridge-Sutton

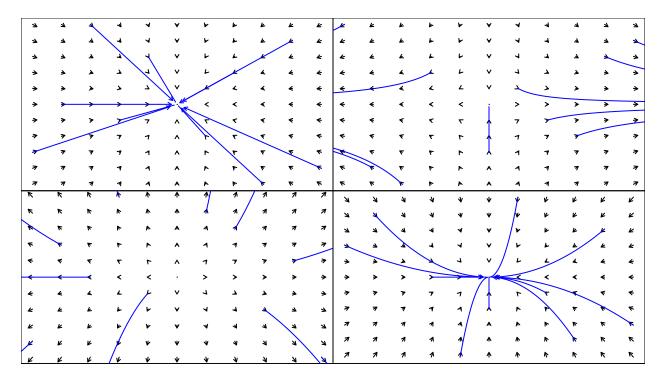

```
# Function to plot vector fields and approximate solutions
plot_vf <- function(Fn) {</pre>
  # Mesh for plot
  1 <- 11
  m \leftarrow seq(-2, 2, 1 = 1)
  y \leftarrow rep(m, 1)
  x \leftarrow rep(m, each = 1)
  # Time step
  dt <- 0.03
  # Arrow head length
  arwl <- 0.04
  # Gradient over mesh
  Fxy \leftarrow Fn(x, y)
  # Plot vector field - gives warnings for points with zero gradient
  plot(x, y, type = 'n', axes = F)
  box()
  defaultW <- getOption("warn")</pre>
  options(warn = -1)
  arrows(x, y, x + dt * Fxy[, 1], y + dt * Fxy[, 2], length = arwl)
  options(warn = defaultW)
  # Number of time steps
  T <- 100
  # Number of solutions
  n_s <- 10
  # Randomly initialize solutions
  x_s \leftarrow y_s \leftarrow matrix(nrow = T, ncol = n_s)
  x_s[1, ] \leftarrow sample(m, n_s)
  y_s[1, ] \leftarrow sample(m, n_s)
  # Approximate solutions with Euler's method
  for (t in 2:T) {
    Fxys \leftarrow Fn(x_s[t - 1, ], y_s[t - 1, ])
    x_s[t, ] \leftarrow x_s[t - 1, ] + dt * Fxys[, 1]
    y_s[t, ] \leftarrow y_s[t - 1, ] + dt * Fxys[, 2]
  # Plot solutions
```

```
matlines(x_s, y_s, col = 'blue', lty = 1)
  options(warn = -1)
  arrows(x_s[T - 1, ], y_s[T - 1, ], x_s[T, ], y_s[T, ], length = arwl,
         col = 'blue')
  options(warn = defaultW)
# Function to plot vector fields and approximate solutions for a linear
# system satisfying a certain set of eigenvalues
plot_vf_evals <- function(e_vals, full_rank = T) {</pre>
  # Gradient function
  Fn <- function(x, y) {
    if (is.complex(e_vals)) {
      H \leftarrow 1 / sqrt(2) * cbind(c(1i, 1), c(1, 1i))
      Re(t(H %*% diag(e_vals) %*% t(Conj(H)) %*% rbind(x, y)))
    }
    else if (full_rank) t(diag(e_vals) %*% rbind(x, y))
    else t( diag(e_vals) %*% rbind(x, y))
  }
  plot_vf(Fn)
```

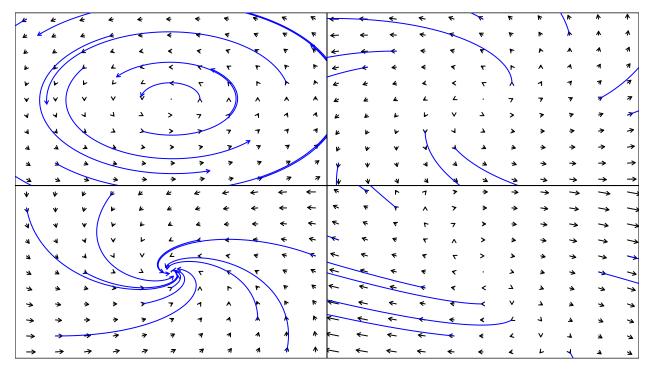

```
# Plot vector fields and approximate solutions satisfying all eigenvalues
par(mfrow = c(2, 2), mar = c(0, 0, 0, 0))
plot_vf_evals(c(0, 0))
plot_vf_evals(c(1, 0))
plot_vf_evals(c(-1, 0))
plot_vf_evals(c(1, 1))
```

```
plot_vf_evals(c(-1, -1))
plot_vf_evals(c(1, -1))
plot_vf_evals(c(1, 2))
plot_vf_evals(c(-1, -2))
```

```
plot_vf_evals(c(1i, -1i))
plot_vf_evals(c(1 + 1i, 1 - 1i))
plot_vf_evals(c(-1 + 1i, -1 - 1i))
plot_vf(Fn = function(x, y) cbind(2 * x + y, -x))
```

The last case is a degenerate source, there is one repeated eigenvalue, and one linearly independent eigenvector, so there is no spectral decomposition. I'm not sure how to specify these matrices in general.

$$plot_vf(Fn = function(x, y) cbind(sin(x^2 + y^2), cos(x + y)))$$
